

Introduction to AI-Monitored Learning

In this lesson, we will cover: - What AI-monitored training is - How AI can adapt pacing - Why static content is important

Lesson 2: Idle Detection

The AI monitors user activity (e.g., clicks, typing, time spent).

If the user appears idle, the AI can: - Prompt them with a quick question

- Check if they are still active
- Adjust pacing to re-engage them

Lesson 3: Adaptive Pacing Heuristics

AI adjusts the course speed based on: - Correctness of answers

- Response time

- Confidence level in replies

Slow learners → more hints, examples.

Fast learners → fewer explanations, more advanced material.

Lesson 4: Interactive AI Tutor Responses

The AI tutor engages with the learner by: - Asking follow-up questions

- Providing examples related to the lesson
- Redirecting to another course if relevant
- Personalizing tone based on user expertise

Lesson 5: Conclusion

AI helps keep learners active, adapts pacing, and makes training more interactive.

This system can evolve to support certification, analytics, and more advanced personalization.
